- 2 Brief introduction to CMI: this is a "language" appropriate for talking about mice.
- 3 An illustration: we will concentrate on one example and will try to explain how to handle some of the technicalities that arise.
- 4 We will then explain some technicalities that arise in developing the necessary tools.
- 5 Warning: we will not have time to explain what a mouse is and what an iteration strategy is. We hope you learned this concepts from Schindler's tutorial and that you will gladly compute the 15th projectum if needed.

What is the core model induction?

It is a technique for calibrating lower bounds of consistency strengths of set theoretic statements.

 $\label{eq:carbon} \begin{array}{c} \mbox{Introduction} \\ \mbox{Canonical models} \\ \mbox{An illustration} \\ \mbox{Other applications} \\ \mbox{Tools one uses} \\ \mbox{Computation of Hod} \\ \mbox{Lower bound for } AD_{\mathbb{R}} + " \Theta \mbox{ is regular"} \end{array}$

Typical applications of the core model induction

1 Forcing axioms: *PFA* and etc.

Grigor Sargsyan The core model induction

Typical applications of the core model induction

- **1** Forcing axioms: *PFA* and etc.
- **2** Combinatorial statements: $\neg \Box_{\kappa}$ where κ is a singular strong limit cardinal and etc.

・ロト ・ 四 ト ・ 回 ト ・ 回 ト

Typical applications of the core model induction

- **1** Forcing axioms: *PFA* and etc.
- **2** Combinatorial statements: $\neg \Box_{\kappa}$ where κ is a singular strong limit cardinal and etc.
- 3 Generic embeddings: generic embeddings given by precipitous ideals, dense ideals and etc.

- 2 (Steel) $AD_{\mathbb{R}} \rightarrow$ there is a proper class model *M* of ZFC such that in *M* there is λ which is a limit of Woodin cardinals and $< \lambda$ -strong cardinals.
- (Woodin) If λ is a limit of Woodin cardinals and < λ-strong cardinals then the derived model at λ satisfies AD_R.

・ロト ・四ト ・ヨト ・ヨト

But where do these axioms hold?

Recall from Steel's talk,

 $A \in C^{\nu} \Leftrightarrow \exists F(F \text{ is a model operator on } H_{\nu}$ with parameter in \mathbb{R} , and $A \text{ is definable over } \langle H_{\omega_1}, \in, F \upharpoonright H_{\omega_1} \rangle).$

Introduction Canonical models An illustration Other applications Tools one uses Computation of Hod Lower bound for AD_R + " Θ is regular"

We take the case $\nu = \omega_2$.

Introduction Canonical models An illustration Other applications Tools one uses Computation of Hod Lower bound for $AD_{\mathbb{R}}$ + " Θ is regular"

We take the case $\nu = \omega_2$.

1 $L(C^{\omega_2}, \mathbb{R})$ is the model that is shown to satisfy axioms from the Solovay hierarchy.

Introduction Canonical models An illustration Other applications Tools one uses Computation of Hod Lower bound for AD_R + " Θ is regular"

We take the case $\nu = \omega_2$.

- 1 $L(C^{\omega_2}, \mathbb{R})$ is the model that is shown to satisfy axioms from the Solovay hierarchy.
- 2 A certain K^c construction of $HOD^{L(C^{\omega_2},\mathbb{R})}$ is the model where it is shown that a certain large cardinal exists.

(日)

Introduction Canonical models An illustration Other applications Tools one uses Computation of Hod Lower bound for *AD*_R + *"*⊖ is regular"

One uses core model induction to show that C^{ω_2} has various closure properties. In this talk we concentrate on the following.

Introduction Canonical models An illustration Other applications Tools one uses Computation of Hod Lower bound for $AD_{\mathbb{R}} + "\Theta$ is regular"

One uses core model induction to show that C^{ω_2} has various closure properties. In this talk we concentrate on the following.

1 Given a theory *S* from the Solovay hierarchy, is there $\Gamma \subseteq C^{\omega_2}$ such that $L(\Gamma, \mathbb{R}) \models S$?

(日)

To illustrate some of the technical ideas involved we concentrate on the following theorem.

э.

Theorem (S.) Assume CH. Suppose $j : V \to M \subseteq V[G]$ is such that 1 $crit(j) = \omega_1$,

2 $(M^{\omega})^{V[G]} \subset M$,

Theorem (S.) Assume CH. Suppose $j : V \to M \subseteq V[G]$ is such that 1 $crit(j) = \omega_1$,

Grigor Sargsyan The core model induction

Theorem (S.)

Assume CH. Suppose $j: V \rightarrow M \subseteq V[G]$ is such that

- **1** *Crit*(*j*) = ω_1 ,
- $2 (M^{\omega})^{V[G]} \subseteq M,$
- 3 G comes from a homogenous forcing,

Theorem (S.)

Assume CH. Suppose $j: V \rightarrow M \subseteq V[G]$ is such that

- **1** *Crit*(*j*) = ω_1 ,
- $2 (M^{\omega})^{V[G]} \subseteq M,$
- 3 G comes from a homogenous forcing,
- **4** ϵ holds where ϵ is the statement " $j \upharpoonright Ord \in V$ ".

Assume CH. Suppose $j: V \rightarrow M \subseteq V[G]$ is such that

- **1** *Crit*(*j*) = ω_1 ,
- $2 (M^{\omega})^{V[G]} \subseteq M,$
- 3 G comes from a homogenous forcing,
- **4** ϵ holds where ϵ is the statement " $j \upharpoonright Ord \in V$ ".

Suppose further that $\Gamma \subseteq \mathcal{P}(\mathbb{R})$ is such that

Assume CH. Suppose $j: V \rightarrow M \subseteq V[G]$ is such that

The following theorem gives an upper bound, however.

Theorem (S.)

 $Con(ZFC+"there is a Woodin limit of Woodins") \to Con(AD_{\mathbb{R}}+"\Theta \ is regular")$

A consequence of this theorem is the following result;

Theorem (S.-Woodin)

It is consistent relative to a Woodin limit of Woodins that $MM^+(c)$ holds.

Introduction Canonical models An illustration Other applications Tools one uses Computation of Hod Lower bound for $AD_{\mathbb{R}}$ + " Θ is regular"

1 CH + " ω_1 -dense ideal on ω_1 " + ϵ + " ω -presaturated ideal on ω_2 " gives \mathcal{M}_1 of $AD_{\mathbb{R}}$ + " Θ is regular" (S.-Steel).

2 Are all full pontclasses "nice"?

Theorem (S.)

Assume there is no inner model containing the reals and satisfying $AD_{\mathbb{R}} + "\Theta$ is regular". Then Γ is a full pointclass iff either $\Gamma = \mathcal{P}(\mathbb{R})$ or $\Gamma = \Gamma(\mathcal{P}, \Sigma)$ for some hod pair (\mathcal{P}, Σ) .

- 2 Given (P, Σ) and (Q, Λ) such that Γ(P, Σ) = Γ(Q, Λ) then they have a common tail (R, Ψ)

Theorem (S.)

comparison

Comparison is true for hod pairs below $AD_{\mathbb{R}} + "\Theta$ is regular".

(日)

We are now ready for outlining the computation of HOD and showing how to prove the theorem we promissed. First lets deal with HOD.

 + " Θ is regular"

We work in the theory " AD^+ +"no inner model containing the reals and satisfying $AD_{\mathbb{R}}$ + " Θ is regular". Fix $\alpha < \Omega$. We want to compute HOD up to θ_{α} . By generation of pointclasses, we have a hod pair (\mathcal{P}, Σ) such that

$$\Gamma(\mathcal{P}, \Sigma) = \{ \boldsymbol{A} \subseteq \mathbb{R} : \boldsymbol{w}(\boldsymbol{A}) < \theta_{\alpha} \}.$$

Let $\mathcal{M}_{\infty}(\mathcal{P}, \Sigma)$ be the direct limit of all iterates of \mathcal{P} via Σ .

< 日 > < 回 > < 回 > < 回 > < 回 > <

1 Because of comparison $\mathcal{M}_{\infty}(\mathcal{P}, \Sigma)$ is independent of (\mathcal{P}, Σ) and depends only on α . This means that

 $\mathcal{M}_\infty(\mathcal{P},\Sigma)\subseteq \text{HOD}.$

Grigor Sargsyan The core model induction

<ロ> <同> <同> < 同> < 同> < 同> < □> <

 Because of comparison M_∞(P, Σ) is independent of (P, Σ) and depends only on α. This means that

$$\mathcal{M}_{\infty}(\mathcal{P}, \Sigma) \subseteq \mathrm{HOD}.$$

2 Then one shows by a long induction that in fact

$$\mathcal{M}_{\infty}|\theta_{\alpha} = \mathrm{HOD}|\theta_{\alpha}.$$

The proof of the theorem

Theorem (S.)

Con(Woodin limit of Wodins) implies $Con(AD_{\mathbb{R}} + "\Theta \text{ is regular"})$.

Grigor Sargsyan The core model induction

Divergent models of AD

1 We say there are divergent models of AD^+ if there are $A, B \subseteq \mathbb{R}$ such that $L(A, \mathbb{R}) \models AD^+$, $L(B, \mathbb{R}) \models AD^+$ but $L(A, B, \mathbb{R}) \models \neg AD^+$.

イロト イヨト イヨト イヨト

Divergent models of AD

- 1 We say there are divergent models of AD^+ if there are $A, B \subseteq \mathbb{R}$ such that $L(A, \mathbb{R}) \models AD^+$, $L(B, \mathbb{R}) \models AD^+$ but $L(A, B, \mathbb{R}) \models \neg AD^+$.
- 2 If $A, B \subseteq \mathbb{R}$ form divergent models of AD^+ then let $Com_{A,B} = \mathcal{P}(\mathbb{R}) \cap L(A,\mathbb{R}) \cap L(B,\mathbb{R}).$

(日)

Divergent models of AD

- 1 We say there are divergent models of AD^+ if there are $A, B \subseteq \mathbb{R}$ such that $L(A, \mathbb{R}) \models AD^+$, $L(B, \mathbb{R}) \models AD^+$ but $L(A, B, \mathbb{R}) \models \neg AD^+$.
- 2 If $A, B \subseteq \mathbb{R}$ form divergent models of AD^+ then let $Com_{A,B} = \mathcal{P}(\mathbb{R}) \cap L(A,\mathbb{R}) \cap L(B,\mathbb{R}).$
- **3** Woodin showed that $L(Com_{A,B}, \mathbb{R}) \vDash AD_{\mathbb{R}}$.

・ロト ・ 母 ト ・ ヨ ト ・ ヨ ト

Theorem (Woodin)

It is consistent relative to a Woodin limit of Woodins that there are divergent models of AD^+ .

<ロ> <同> <同> < 同> < 同> < 同> < □> <

Theorem (Woodin)

It is consistent relative to a Woodin limit of Woodins that there are divergent models of AD^+ .

Hence, it is enough to show that the existence of the divergent models of AD^+ gives a model of $AD_{\mathbb{R}}$ + " Θ is regular".

・ロト ・四ト ・ヨト ・ヨト

3

So, suppose $A, B \subseteq \mathbb{R}$ form divergent models of AD^+ yet there is no inner model of $AD_{\mathbb{R}} + "\Theta$ is regular".

Introduction Canonical models An illustration Other applications Tools one uses Computation of Hod Lower bound for $AD_{\mathbb{R}}$ + " Θ is regular"

1 Applying generation of pointclasses in $L(A, \mathbb{R})$, we get a hod pair $(\mathcal{P}, \Sigma) \in L(A, \mathbb{R})$ such that $\Gamma(\mathcal{P}, \Sigma) = Com_{A,B}$.

Introduction Canonical models An illustration Other applications Tools one uses Computation of Hod Lower bound for $AD_{\mathbb{R}}$ + " Θ is regular"

- 1 Applying generation of pointclasses in $L(A, \mathbb{R})$, we get a hod pair $(\mathcal{P}, \Sigma) \in L(A, \mathbb{R})$ such that $\Gamma(\mathcal{P}, \Sigma) = Com_{A,B}$.
- 2 Doing the same in $L(B, \mathbb{R})$, we get $(Q, \Lambda) \in L(B, \mathbb{R})$ such that $Com_{A,B} = \Gamma(Q, \Lambda)$.

<ロ> <同> <同> < 同> < 同> < 同> < □> <

```

Now compare (\mathcal{P}, Σ) and (\mathcal{Q}, Λ) . We get a common tail (\mathcal{R}, Ψ) .

- **1** Because (\mathcal{R}, Ψ) is a tail of (\mathcal{P}, Σ) , $(\mathcal{R}, \Psi) \in L(\mathcal{A}, \mathbb{R})$.
- **2** Because (\mathcal{R}, Ψ) is a tail of (\mathcal{Q}, Λ) , $(\mathcal{R}, \Psi) \in L(B, \mathbb{R})$.
- **3** But then $(\mathcal{R}, \Psi) \in Com_{A,B}$.

```
Introduction
Canonical models
An illustration
Other applications
Tools one uses
Computation of Hod
Lower bound for AD_R + "\Theta is regular"
```

Now compare (\mathcal{P}, Σ) and (\mathcal{Q}, Λ) . We get a common tail (\mathcal{R}, Ψ) .

- **1** Because (\mathcal{R}, Ψ) is a tail of (\mathcal{P}, Σ) , $(\mathcal{R}, \Psi) \in L(\mathcal{A}, \mathbb{R})$.
- **2** Because (\mathcal{R}, Ψ) is a tail of (\mathcal{Q}, Λ) , $(\mathcal{R}, \Psi) \in L(B, \mathbb{R})$.
- **3** But then $(\mathcal{R}, \Psi) \in Com_{A,B}$.
- However, Γ(R, Ψ) = Γ(P, Σ) = Γ(Q, Λ) = Com_{A,B}, giving a contradiction.

The End.
